# Software Development Lifecycle (SDLC) ▼

## UNDERSTANDING REQUIREMENTS:

Identify and document the needs and requirements of the project. This involves gathering information from stakeholders to define the scope, features, and functionalities of the product.

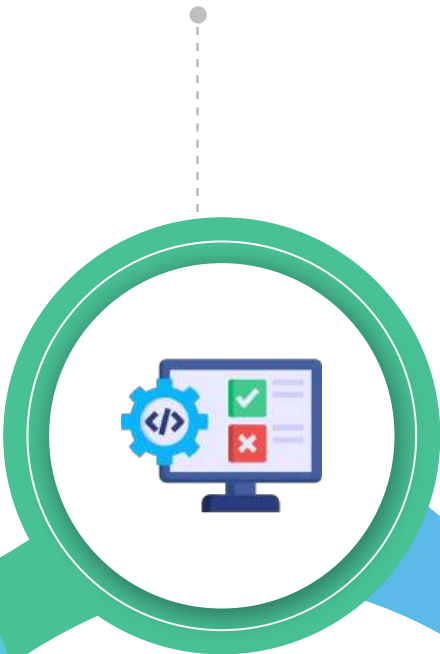

## DESIGN:

Create a detailed design based on the requirements. This includes architectural design, system specifications, and user interface design. The goal is to create a blueprint for the development team to follow.

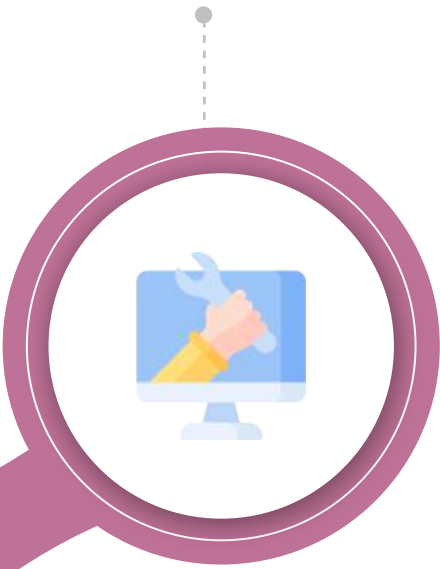

## TESTING:

Perform various levels of testing to identify and fix bugs and ensure the product meets the specified requirements. This includes unit testing, integration testing, system testing, and user acceptance testing.

## Maintenance, Support & Documentation:

After deployment, the product enters a maintenance phase where developers address issues, release updates, and provide ongoing support including technical documentation for developers, user documentation for end-users to facilitate future development and maintenance.

## Planning:

Develop a plan that outlines the project timeline, resource requirements, budget, and milestones. This phase also involves risk assessment and mitigation planning.

## Development (Coding):

Write code based on the design specifications. This phase involves converting the design into actual working code. Developers follow coding standards and best practices to ensure the code is maintainable and scalable

## Deployment:

Release the product to the intended environment, whether it's a live server, a test environment, or a client's system. Deployment may involve installing the software, configuring it, and ensuring it works as expected in the target environment.

# PRODUCT OF Akaar IT Ltd.
