Your Solution Partner

Recent Touch Bangladesh Limited uses RAIN RFID technology, machine learning and analytics to offer an industry leading platform, TagMatiks. Our customers leverage TagMatiks for use cases like Asset Tracking, Field Inventory, Uniform Tracking, Work in Progress, Medical Set Tracking and more. As a trusted leader in the market, we have been offering RFID solutions for more than two decades.

Recent Touch Store- RFID Hardware

TAGMATIKS™

We offer various choices to start your RFID driven Asset Tracking initiative:

TagMatiks AT Lite

TagMatiks AT is an enterprise solution and include both a cloud-based portal as well as mobility applications. It includes extensive analytics and reporting features. With TagMatiks AT Lite, you can launch your RFID asset tracking campaign quickly and affordably. The method works well for proof-of-concept projects or when you have a few hundred to a few thousand assets on a single site with a single reader. The answer is to add additional assets for a flat fee per asset once the first 99 are added for free. TagMatiks AT offers a straightforward one-click migration if you want to upgrade to the business version. Ready to deploy, pre-printed, and pre-encoded RFID tags are compatible with the solution. In just a few minutes, you may launch your RFID asset tracking programs. On the other hand, TagMatiks AT Lite is an all-in-one application designed to make it easy to start an RFID based asset tracking project.

TagMatiks AT

Using RFID and other sensory technologies, TagMatiks AT delivers multi-site, worldwide asset tracking capabilities. Custom fields, user roles, and single sign-on provide the system a lot of configuration flexibility. Utilize over 100 pre-built reports or create your own. Use personalized dashboards to keep tabs on important indicators, and make use of the powerful APIs to integrate systems like SAP, Service Now, Salesforce, Oracle Apps, Infor, and many others quickly and easily. The program is designed to be the program of choice for RFID asset tracking applications and is compatible with the majority of industry-leading RFID devices.

ASSET TRACKING

Every organization must have effective asset management and tracking systems. When a company owns multiple fixed assets that are identical, it can be very easy to make mistakes by creating duplicate asset records or failing to dispose of the correct asset, when identical assets are retired. With the use of RFID technology, TagMatiks automates asset management while improving asset accuracy, usage, and maintainability.

TagMatiks Wedge

With your iOS or Android-paired RFID handhelds or sled, do you want to only scan RFID tags? TagMatiks Wedge is an affordable and adaptable way to quickly gather data and send it to your backend systems.

FIELD INVENTORY

An RFID inventory management system is a device that tracks and manages inventory with real-time updates using radio frequency identification (RFID) tags. The system consists of three parts: RFID tags, RFID readers, and an RFID software program. Each of the RFID labels used for inventory management has a unique identifier and is connected to the things being tracked. RFID readers communicate with the tags using radio waves, and the software program serves as a database to keep track of and manage the data gathered.

TagMatiks AT

A cloud-based asset monitoring tool called TagMatiks FI makes use of multiple AIDC technologies to gather and analyze data. Beacons, barcodes, RFID, and other technologies are among them. Users may simply manage their field inventory through data gathering and a range of field operations. Through a variety of dashboards, the platform also enables users to locate assets globally and view an asset's complete history.

SOLUTIONS USING TAGMATIKS

Providing Innovative and Sustainable Solutions

TagMatiks is a next generation RFID software platform for data collection. At the heart of the platform is TagMatiks Core, a middleware software component that includes extensive reader management and enterprise grade integration capabilities. In conjunction, there is a business suite of software applications to solve everyday business needs with vertical based workflows, reporting, analytical and dashboard capabilities.
